Stock Analysis Dashboard

A god-like secretary for premium-selling decisions.

What the dashboard does, how it differs from a Bloomberg terminal or a retail screener, and why it earns ninety seconds of an experienced operator's attention.

PREPARED FOR

Mike McAteer
and the advisory group

LIVE DASHBOARD

promptaisolutions.com/stock-analysis/

promptaisolutions.com

WHAT THIS TOOL IS

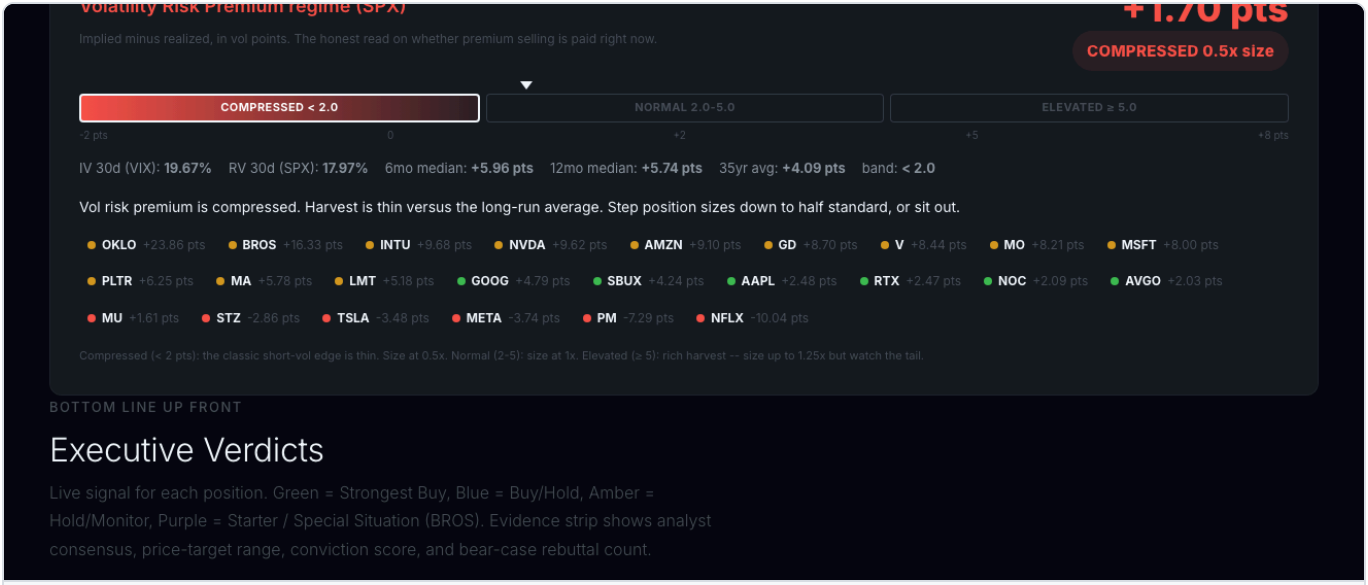
A scannable, opinionated, single page.

A free public web dashboard scoped to one strategy: selling options premium on a curated watchlist of names you already know. You open it in a browser, scan it for under two minutes, and decide. It never tells you what to do.

No login. No account. No download. Updated automatically twice every weekday during US market hours, then left alone overnight. Anyone with the link sees what Mike sees; nothing on the public surface is personalized.

The watchlist universe (24 tickers, four baskets)

BASKET	TICKERS
Mega-cap tech the original 9	MU, META, NVDA, MSFT, AMZN, GOOG, AAPL, TSLA, BROS
Defense primes	LMT, RTX, NOC, GD, PLTR
Addictive consumer staples	PM, MO, STZ, SBUX, NFLX
Payment rails and infrastructure	V, MA, INTU, AVGO, OKLO



Top of the live dashboard: volatility risk premium tile framing every other number on the page, followed by a 9-card verdict grid for the original mega-cap basket. Live price, analyst target, conviction score, and bear-case knockdowns per name.

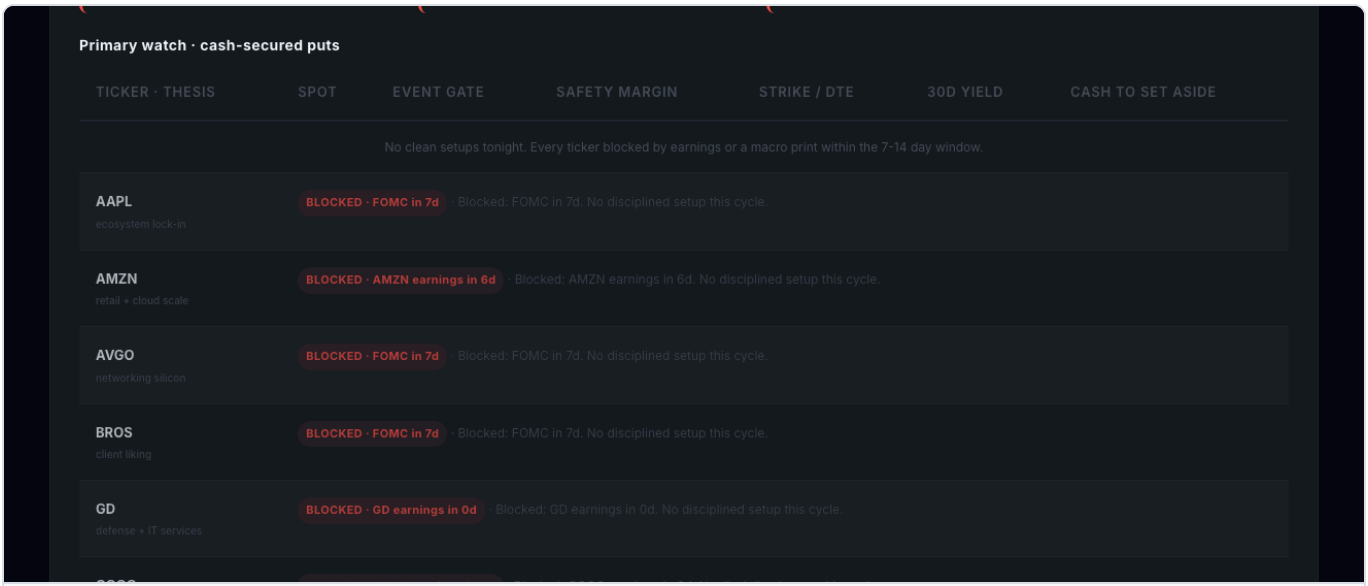
IN ONE SENTENCE

> It shows you which options you could sell today on a curated watchlist of stocks, with passive visual cues highlighting the high-yield, the about-to-expire, and the earnings-blocked, so you can decide for yourself.

HOW IT WORKS

A small autonomous pipeline on a fixed schedule.

1. **Pull fresh option chains from CBOE** twice every weekday: a **morning settle** run at 10:33 AM Eastern (07:33 PT), once the open has stopped thrashing, and a **pre-close prep** run at 2:33 PM Eastern (11:33 PT). The afternoon slot is deliberately before the 3-4 PM ET zero-day-to-expiry reversal window, so the data reflects a settled tape rather than a churning one.
2. **Apply an event filter.** Any expiration that spans a known earnings release, an FOMC decision, a CPI print, or a non-farm payrolls release is dropped. You will never see a setup quoted across an event the underwriter cannot price.
3. **Pick the disciplined-seller candidate per ticker.** The spine is 7 to 14 days to expiry, 0.15 to 0.25 delta, open interest at or above 500 contracts, bid-ask spread at or under 5%. Names that fail the liquidity gate are still shown; they are flagged so you can see why.
4. **Compute the volatility risk premium regime.** Implied volatility minus realized volatility. If the premium is compressed, position sizing drops to half standard. If it is rich, sizing can step up to 1.25x with a tail-risk caveat. The regime tile sits at the top of the page so it frames every other number.
5. **Render the dashboard.** The page is rebuilt from canonical JSON inputs by deterministic Python renderers. Identical input gives byte-identical output. Nothing is hand-edited.
6. **Mike opens his browser, scans, decides.** No sign-in, no account, no personalization. The dashboard is the artifact.



Working surface. Twenty-four rows, one per ticker. Earnings-blocked and macro-blocked rows are flagged red so you can see at a glance how much of the universe is tradable today and how much is not. The primary-watch sub-table below shows the single best cash-secured-put candidate per name when one survives every gate.

There is no email, no alert, no push notification. The dashboard is the only output surface. Mike and his advisory peers check it when they want to; nothing arrives in anyone's inbox. That is deliberate -- silence by default means there is no risk of an automated message saying something the operator does not endorse.

WHY THIS IS DIFFERENT FROM WHAT YOU ALREADY HAVE

Scope and posture, not coverage.

Mike's advisory group already has Bloomberg, broker research portals, retail option screeners, and decades of pattern recognition. The dashboard does not try to compete with any of them on coverage. It competes on scope and posture.

YOU ALREADY HAVE	WHAT IT GIVES YOU	WHERE THIS DASHBOARD DIFFERS
Bloomberg, broker research portals	Encyclopedic coverage. Everything about everything.	Opinionated about the universe and the strategy. Less surface area, more actionability. You stop scrolling sooner.
Retail option screeners Barchart, OptionStrat	Screen the entire option universe by criteria.	Scoped to twenty-four names you already follow. Chaos-aware: rows are flagged by event proximity and liquidity, not just sorted by yield.
Analyst research, newsletters	Tell you what to buy.	Never tells you what to do. Surfaces the live options market and lets you decide.
Roll-your-own spreadsheets	Exactly what you want, until you stop maintaining them.	Autonomous. Fresh every market session without a human in the loop.

The secretary framing

A competent secretary does not tell the boss what to do. She knows everyone in the room, has the agenda ready, anticipates needs, and makes the boss's day flow.

This dashboard is that secretary, scoped to options selling. It pulls the chains. It blocks earnings-spanning expirations. It flags compressed volatility regimes that should shrink position sizing. It surfaces Thursday-optimal weekend-theta candidates. It tells you nothing about what to trade.

That posture matters more than any single feature. A Bloomberg-using professional who reads "buy this, sell that" three hundred times a day has every reason to ignore the three-hundred-and-first source. A surface that earns ninety seconds of attention is a surface that respects the operator's judgment.

A TYPICAL MIKE SESSION

Ninety seconds, no opinions.

> It is Thursday, 10:35 AM Eastern. Mike opens the dashboard on his phone over coffee.
>
> The regime tile reads **VRP compressed, 0.5x size**. He internalizes that. Whatever he writes today, he writes half size.

> He scans the Option Selling Watch table. Nineteen of twenty-four rows are flagged red: **FOMC in 7d. No disciplined setup this cycle.** Three rows are flagged for individual earnings within the window. Two rows are clean.
>
> Both clean rows carry a **THU-OPT** badge: today is Thursday and a next-Friday expiry exists, which means the contract decays through a weekend without market hours. Sellable.
>
> He taps the higher-yield row, opens his broker on the same phone, places a half-size cash-secured put. Done.
>
> **Total elapsed time: ninety seconds.** The dashboard never told him to trade. It told him which rows were not blocked and which carried the weekend-theta tailwind. He decided.

Privacy

The public dashboard never shows holdings, share counts, cash balances, cost basis, or assignment events. None of that is on the URL above and none of it ever will be. There is no personalization layer at all -- the page is identical for every viewer.

Safety

The tool sends no emails. It places no trades. It has no broker connection. It moves no money. It is a read-only artifact rendered to a static page. The operator decides what, if anything, to do with it.

Disclosures: the dashboard is educational and is not financial advice. Every reader makes their own decisions. The site carries explicit "limitations" copy in its header for the same reason.

IF YOUR GROUP WANTS A SIMILAR DASHBOARD | ENGAGE

The pattern generalizes. One strategy, a curated watchlist, an autonomous pipeline, a scannable single page, no opinions. If a member of the group wants a version scoped to their own universe and strategy (covered calls on dividend names, cash-secured puts on industrials, calendar spreads on commodity ETFs), the build is straightforward.
